Configuring Polycom Soundstation conference phones - Media Manager

70 Jonathan Sun, Jul 30, 2017 Media Manager 2222

The easiest method of configuring the ip6000 / ip7000 conference phones is using the phone interface rather than the phones web interface.

Once the phone has finished booting up, press the menu button, and then select:

settings > advanced

The default password is "456", after which press the enter softkey.

Then select:

admin settings > sip configuration

enter the following information in the subsections:

server

address:	ip.of.media.manager
port:	5060
transport:	naptr

outbound proxy

address:	ip.of.media.manager
port:	5060
transport:	naptr

line 1

display name:	name of extension user
address:	extension number
label:	name of extension user
third party name:	extension
auth user id:	extension
auth password:	extension password

Then exit this menu, and save the config.

This will restart the phone, which should then register.
